XJIRA

JIRA had problems starting up

This page is for JIRA administrators. If you're seeing this page, your JIRA administrator is probably working to restore the service.

JIRA encountered the following problems during startup. You need to fix any errors before you start JIRA again.

Warnings should be fixed, but you can choose to ignore them and continue starting JIRA.

Database: JIRA couldn't connect to your database

JIRA failed to establish a connection to your database.

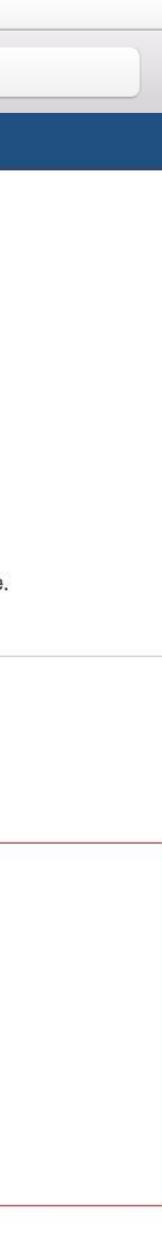

• The configuration of your dbconfig.xml file is incorrect (user, password, or database URL etc.)

• There is a network issue between JIRA and your database (e.g. firewall, database doesn't allow remote access etc.)

There are several other solutions you can try, review our documenation and see what works for you.

Database: Your database is using an unsupported collation

Your mysql database is currently using an unsupported collation: utf8_general_ci. You should change this to a supported collation:

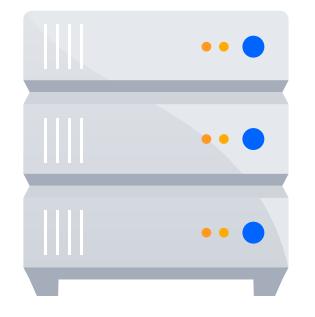

Long-haul plans Future explorations for JIRA

JIRA Team Explorations

JIRA Data Center

Performance at Scale

Support for the growing teams

Data Portability

Consolidation ease for organizations

Geo-clustering

Improved efficiency for distributed teams

Deployment flexibility

Seamless deployment on different laaS

Admin productivity

Continue working on Project Level Administration, Priorities per projects, ...

End user productivity

I need more granular configuration	for my projects:		Created:	27/May/2004 6:0
to specify different priorities for different projects instead of having a global priority list. The current be used as a default, but I would like to be able to change them per project. It issue type, the resolution may be different. For example: in case of bugs, the resolution may be in case of improvements there is nothing to fix and the resolution should rather be "implemented". I specify the default resolution separately per each issue type.				4 days ago
